

while loop:

```
while (condition) {  
    // statements  
}
```

It runs as long as the condition is true.

top-down approach

even odd
($i \% 2 == 0$)

Example

```
int i = 1;  
while (i <= 5) {  
    System.out.println("Number : " + i);  
    i++;  
}
```

Prime number

leap year(4, 400, 200)

Do-while loop:

```
do {  
    // statements  
} while (condition);
```

Bottom-up approach.

Enhanced for loop:

```
for (dataType variable : arrayName) {  
    // statement  
}
```

Used to iterate through arrays (or) collections

easily.

(Ex: Book Ticket as we want not in order)

```

Public class EnhancedFor {
    Public static void main (String [] args) {
        int [] arr = {1, 2, 3, 4, 5};

        int sum = 0;
        for (int num : arr) {
            sum += num;
        }
        System.out.println ("sum = " + sum);
    }
}

```

[0] → Index value

(all elements of a string array.)
